Kamal Maher

kamal.m.maher@gmail.com · kmaherx.github.io · github.com/kmaherx

Research interests: Agents · Evals · Interpretability · Biology

Education

2020 – 2025 | **Massachusetts Institute of Technology**, PhD in Computational Biology

2014 – 2018 | **Cornell University**, BS in Neuroscience

Experience

2026 – | **SecureBio**, Senior Research Fellow
- Built a multi-agent system that automatically designs tasks for agentic evaluations of biological capabilities in frontier models.

2025 – 2026 | **SPAR**, Research Fellow
- Built an agent that explains learned representations in large language models by iteratively proposing, scoring, and refining its own explanations, improving explanation accuracy by 7.7% over existing methods. [1]
- Demonstrated that a widely-used mechanistic interpretability method is incentivized to learn unfaithful explanations of neural network computation. [2]

2021 – 2025 | **Massachusetts Institute of Technology**, Graduate Researcher
- Developed a spectral graph ML framework for spatial transcriptomics and applied it to a 1.09M-cell mouse brain atlas, revealing transcriptional gradients and regions absent from established anatomical references. [3]

2024 | **Genentech**, Aviv Regev Lab Intern
- Benchmarked the framework against graph neural network (GNN) approaches on cancer spatial transcriptomics, recovering tumor regions and cell–cell interactions at a fraction of the compute.
